SMS One Time Passwords

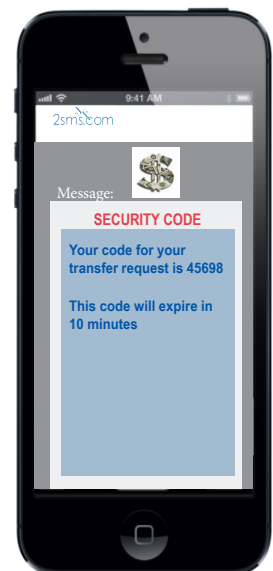

OVERVIEW

Using a single username and password to gain access presents a security risk. Many organizations choose a range of additional authentication processes including two factor authentication to access their corporate systems.

SMS

Use SMS to send one-time passcodes. We have the software available to automate this process, and we can guide you through the set up process. SMS has the additional benefit of logging messages sent, allowing you to keep track of one time passwords issued. We connect to a range of third party VPN software solutions which use one time passwords.

UPGRADE WITH SMS+

SMS+ enhances regular SMS. With longer message length and rich content, you also gain the ability to brand your messages with your corporate logo. You can encrypt your messages, and set them to expire after a certain time. Messages sent via SMS+ can be read only by the intended user, providing the ideal solution for your more sensitive communications.
